Preface	xiii
<b>Gerhard Huisken</b>	
<b>Heat Diffusion in Geometry</b>	1
Heat Diffusion in Geometry	3
1. Heat diffusion	3
2. Curve shortening	5
3. Mean curvature flow	8
4. Ricci flow	10
5. Towards surgery	12
Bibliography	13
<b>Peter Topping</b>	
<b>Applications of Hamilton's Compactness Theorem for Ricci Flow</b>	15
Overview	17
Lecture 1. Ricci flow basics – existence and singularities	19
1.1. Initial PDE remarks	19
1.2. Basic Ricci flow theory	20
Lecture 2. Cheeger-Gromov convergence and Hamilton's compactness theorem	23
2.1. Convergence and compactness of manifolds	23
2.2. Convergence and compactness of flows	25
Lecture 3. Applications to Singularity Analysis	27
3.1. The rescaled flows	27
3.2. Perelman's no local collapsing theorem	28
Lecture 4. The case of compact surfaces – an alternative approach to the results of Hamilton and Chow	31
Lecture 5. The 2D case in general – Instantaneously complete Ricci flows	35
5.1. How to pose the Ricci flow in general	35
5.2. The existence and uniqueness theory	36
5.3. Asymptotics	38
5.4. Singularities not modelled on shrinking spheres	39

Lecture 6. Contracting Cusp Ricci flows	41
Lecture 7. Subtleties of Hamilton's compactness theorem	45
7.1. Intuition behind the construction	46
7.2. Fixing proofs requiring completeness in the extended form of Hamilton's compactness theorem	47
Bibliography	49
<b>Ben Weinkove</b>	
<b>The Kähler-Ricci flow on compact Kähler manifolds</b>	51
Preface	53
Lecture 1. An Introduction to Kähler geometry	55
1.1. Complex manifolds	55
1.2. Vector fields, 1-forms, Hermitian metrics and tensors	56
1.3. Kähler metrics and covariant differentiation	59
1.4. Curvature	61
Lecture 2. The Kähler-Ricci flow and the Kähler cone	65
2.1. The Kähler-Ricci flow and simple examples	65
2.2. The Kähler cone and the first Chern class	66
2.3. Maximal existence time for the Kähler-Ricci flow	68
Lecture 3. The parabolic complex Monge-Ampère equation	71
3.1. Reduction to the complex Monge-Ampère equation	71
3.2. Estimates on $\varphi$ and $\dot{\varphi}$	74
3.3. Estimate on the metric	76
3.4. Higher order estimates	78
Lecture 4. Convergence results	81
4.1. Negative first Chern class	81
4.2. Zero first Chern class	85
Lecture 5. The Kähler-Ricci flow on Kähler surfaces, and beyond	89
5.1. Riemann surfaces	89
5.2. Kähler surfaces, blowing up and Kodaira dimension	89
5.3. Behavior of the Kähler-Ricci flow on Kähler surfaces	91
5.4. Non-Kähler surfaces and the Chern-Ricci flow	95
Appendix A. Solutions to exercises	99
Bibliography	105
<b>Steve Zelditch</b>	
<b>Park City lectures on Eigenfunctions</b>	109
Section 1. Introduction	111
1.1. The eigenvalue problem on a compact Riemannian manifold	112
1.2. Nodal and critical point sets	114

1.3. Motivation	115
Section 2. Results	116
2.1. Nodal hypersurface volumes for $C^\infty$ metrics	116
2.2. Nodal hypersurface volumes for real analytic $(M, g)$	117
2.3. Number of intersections of nodal sets with geodesics and number of nodal domains	117
2.4. Dynamics of the geodesic or billiard flow	119
2.5. Quantum ergodic restriction theorems and nodal intersections	120
2.6. Complexification of $M$ and Grauert tubes	121
2.7. Equidistribution of nodal sets in the complex domain	122
2.8. Intersection of nodal sets and real analytic curves on surfaces	122
2.9. $L^p$ norms of eigenfunctions	124
2.10. Quasi-modes	126
2.11. Format of these lectures and references to the literature	127
Section 3. Foundational results on nodal sets	128
3.1. Vanishing order and scaling near zeros	128
3.2. Proof of Proposition 1	129
3.3. A second proof	130
3.4. Rectifiability of the nodal set	130
Section 4. Lower bounds for $\mathcal{H}^{m-1}(\mathcal{N}_\lambda)$ for $C^\infty$ metrics	130
4.1. Proof of Lemma 4.4	132
4.2. Modifications	135
4.3. Lower bounds on $L^1$ norms of eigenfunctions	135
4.4. Dong's upper bound	135
4.5. Other level sets	136
4.6. Examples	137
Section 5. Quantum ergodic restriction theorem for Dirichlet or Neumann data	138
5.1. Quantum ergodic restriction theorems for Dirichlet data	138
5.2. Quantum ergodic restriction theorems for Cauchy data	139
Section 6. Counting intersections of nodal sets and geodesics	141
6.1. Kuznecov sum formula on surfaces	141
Section 7. Counting nodal domains	142
Section 8. Analytic continuation of eigenfunctions to the complex domain	144
8.1. Grauert tubes	144
8.2. Weak * limit problem for Husimi measures in the complex domain	145
8.3. Background on currents and PSH functions	146
8.4. Poincaré-Lelong formula	146
8.5. Pluri-subharmonic functions and compactness	146
8.6. A general weak* limit problem for logarithms of Husimi functions	147
Section 9. Poisson operator and Szegő operators on Grauert tubes	147
9.1. Poisson operator and analytic Continuation of eigenfunctions	147
9.2. Analytic continuation of the Poisson wave group	148
9.3. Complexified spectral projections	149
9.4. Poisson operator as a complex Fourier integral operator	149

9.5. Toeplitz dynamical construction of the wave group	151
Section 10. Equidistribution of complex nodal sets of real ergodic eigenfunctions	151
10.1. Sketch of the proof	152
10.2. Growth properties of complexified eigenfunctions	154
10.3. Proof of Lemma 10.6 and Theorem 10.3	155
10.4. Proof of Lemma 10.8	156
10.5. Proof of Lemma 10.7	156
Section 11. Intersections of nodal sets and analytic curves on real analytic surfaces	157
11.1. Counting nodal lines which touch the boundary in analytic plane domains	158
11.2. Application to Pleijel's conjecture	162
11.3. Equidistribution of intersections of nodal lines and geodesics on surfaces	163
11.4. Real zeros and complex analysis	166
Section 12. $L^p$ norms of eigenfunctions	166
12.1. Generic upper bounds on $L^p$ norms	166
12.2. Lower bounds on $L^1$ norms	167
12.3. Riemannian manifolds with maximal eigenfunction growth	168
12.4. Theorem 9	169
12.5. Sketch of proof of Theorem 9	170
12.6. Size of the remainder at a self-focal point	172
12.7. Decomposition of the remainder into almost loop directions and far from loop directions	173
12.8. Points in $M \setminus \overline{\mathcal{TL}}$	173
12.9. Perturbation theory of the remainder	173
12.10. Conclusions	174
Section 13. Appendix on the phase space and the geodesic flow	174
Section 14. Appendix: Wave equation and Hadamard parametrix	176
14.1. Hormander parametrix	177
14.2. Wave group: $r^2 - t^2$	178
14.3. Exact formula in spaces of constant curvature	179
14.4. $\mathbb{S}^n$	180
14.5. Analytic continuation into the complex	181
Section 15. Appendix: Lagrangian distributions, quasi-modes and Fourier integral operators	181
15.1. Semi-classical Lagrangian distributions and Fourier integral operators	181
15.2. Homogeneous Fourier integral operators	183
15.3. Quasi-modes	184
Section 16. Appendix on Spherical Harmonics	185
16.1. Highest weight spherical harmonics	187
16.2. Spherical harmonics as quasi-modes	188
Bibliography	189

<b>Jeff A. Viaclovsky</b>	
<b>Critical Metrics for Riemannian Curvature Functionals</b>	<b>195</b>
Introduction	197
Lecture 1. The Einstein-Hilbert functional	199
1. Notation and conventions	199
2. First variation	200
3. Normalized functional	201
4. Second variation	202
5. Transverse-traceless variations	203
Lecture 2. Conformal geometry	205
1. Conformal variations	205
2. Global conformal minimization	206
3. Green's function metric and mass	207
4. The Yamabe Problem	208
5. Generalizations of the Yamabe Problem	209
Lecture 3. Diffeomorphisms and gauging	211
1. Splitting	211
2. Second variation as a bilinear form	212
3. Ebin-Palais slice theorem (infinitesimal version)	213
4. Saddle point structure and the smooth Yamabe invariant	215
Lecture 4. The moduli space of Einstein metrics	217
1. Moduli space of Einstein metrics	217
2. The nonlinear map	218
3. Structure of nonlinear terms	219
4. Existence of the Kuranishi map	220
5. Rigidity of Einstein metrics	221
Lecture 5. Quadratic curvature functionals	225
1. Quadratic curvature functionals	225
2. Curvature in dimension four	227
3. Einstein metrics in dimension four	228
4. Optimal metrics	229
5. Anti-self-dual or self-dual metrics	230
Lecture 6. Anti-self-dual metrics	233
1. Deformation theory of anti-self-dual metrics	233
2. Weitzenböck formulas	234
3. Calabi-Yau metric on K3 surface	235
4. Twistor methods	237
5. Gluing theorems for anti-self-dual metrics	237
Lecture 7. Rigidity and stability for quadratic functionals	239
1. Strict local minimization	239

2. Local description of the moduli space	241
3. Some rigidity results	243
4. Other dimensions	244
Lecture 8. ALE metrics and orbifold limits	245
1. Ricci-flat ALE metrics	245
2. Non-collapsed limits of Einstein metrics	247
3. $B^t$ -flat metrics	249
4. Non-collapsed limits of $B^t$ -flat metrics	251
Lecture 9. Regularity and volume growth	253
1. Local regularity	253
2. Volume growth estimate	254
3. ALE order and removable singularity theorems	255
4. Chen-LeBrun-Weber metric	257
Lecture 10. A gluing theorem for $B^t$ -flat metrics	259
1. Existence of critical metrics	259
2. Lyapunov-Schmidt reduction	260
3. The building blocks	261
4. Remarks on the proof	262
Bibliography	267
<b>Fernando C. Marques and André Neves</b>	
<b>Min-max theory and a proof of the Willmore conjecture</b>	275
Introduction	277
Part 1. Canonical Family and Degree Calculation	281
Part 2. Min-Max Theory and Ruling Out Great Spheres	287
Part 3. Proof of the Main Theorems and the Energy of Links	291
Bibliography	299
<b>Tristan Rivière</b>	
<b>Weak immersions of surfaces with <math>L^2</math>-bounded second fundamental form</b>	301
Introduction	303
Lecture 1. Notations and fundamental results on the differential geometry of surfaces	307
1. Notations	307
2. Immersions and their geometry	308
3. Conformal invariance of the Willmore Energy	314
4. Two-dimensional geometry in isothermal charts	316
5. Existence of isothermal coordinates and the Chern moving frame method	321
6. Some facts on Riemann surfaces	324

Lecture 2. The space of weak immersion with $L^2$ -bounded second fundamental form	329
1. Definition	329
2. Fundamental results on integrability by compensation	330
3. Existence of isothermal coordinates in the weak framework	335
4. Hélein's energy controlled lifting theorem	336
5. Construction of local Coulomb frames with controlled $W^{1,2}$ -energy	336
6. The Chern moving frame method in the weak framework	337
Lecture 3. Sequences of weak immersions	341
1. Compactness question	341
2. Control of the conformal factor	346
3. The monotonicity formula and consequences	350
4. Proof of the almost-weak closure theorem	352
5. Weak branched immersions	359
6. Weak sequentially closedness of $\mathcal{F}_\Sigma$	363
Lecture 4. The Willmore surface equation	365
Lecture 5. Conservation laws for weak Willmore immersions	371
1. The regularity of weak Willmore immersions	376
2. A minimization procedure for the Willmore energy among weak branched immersions	380
Bibliography	383
<b>Brian White</b>	
<b>Introduction to Minimal Surface Theory</b>	385
Introduction	387
Lecture 1. The First Variation Formula and Consequences	389
Monotonicity	392
Density at infinity	393
Extended monotonicity	394
The isoperimetric inequality	398
Lecture 2. Two-Dimensional Minimal Surfaces	401
Relation to harmonic maps	401
Conformality of the Gauss map	402
Total curvature	403
The Weierstrass Representation	406
The geometric meaning of the Weierstrass data	408
Rigidity and Flexibility	409
Lecture 3. Curvature Estimates and Compactness Theorems	411
The $4\pi$ curvature estimate	413
A general principle about curvature estimates	414

An easy version of Allard's Regularity Theorem	415
Bounded total curvatures	415
Stability	418
Lecture 4. Existence and Regularity of Least-Area Surfaces	423
Boundary regularity	428
Branch points	428
The theorems of Gulliver and Osserman	429
Higher genus surfaces	430
What happens as the genus increases?	431
Embeddedness: The Meeks-Yau Theorem	432
Bibliography	435
