## Contents

1. Introduction  
   1.1.  
   1.2. Notation, conventions and review  
2. The homotopic category  
   2.1. \( k \)-spaces  
   2.2. The homotopic category  
   2.3. Base change by a smooth morphism  
3. Homotopic excision, homotopic purity and projective blowups  
   3.1. Mayer-Vietoris property and \( \check{\text{C}}\text{ech} \) descent  
   3.2. Homotopic purity  
   3.3. Projective blowups  
4. Homotopic classification of vector bundles  
   4.1. Excision properties for the Picard group and algebraic \( K \)-theory  
   4.2. Homotopic classification of vector bundles and of \( GL \)-torsors  
   4.3. Higher algebraic \( K \)-theory and periodicity  
   4.4. Homotopy theory over a regular scheme  
Appendix A: Review of homotopic algebra  
   A.1. Lifting properties  
   A.2. Homotopy theory associated to a quasi-simplicial category with cofibrations and weak equivalences  
   A.3. Homotopic limits and colimits  
Appendix B: Ample families of invertible bundles on a scheme  
   B.1. Elementary open subsets of a scheme  
   B.2. Schemes admitting an ample family  
   B.3. Smooth \( k \)-schemes and \( k \)-spaces  
   B.4. Torsors of Jouanolou-Thomason and \( k \)-spaces
