Preface	xi
Background and overview	1
Chapter 0. Introduction	3
0.1. The Classification Theorem	3
0.2. Principle I: Recognition via local subgroups	4
0.3. Principle II: Restricted structure of local subgroups	7
0.4. The finite simple groups	16
0.5. The Classification grid	19
Chapter 1. Overview: The classification of groups of Gorenstein-Walter type	25
The Main Theorem for groups of Gorenstein-Walter type	25
1.1. A strategy based on components in centralizers	26
1.2. The Odd Order Theorem	28
1.3. (Level 1) The Strongly Embedded Theorem and the Dichotomy Theorem	29
1.4. The 2-Rank 2 Theorem	33
1.5. (Level 1) The Sectional 2-Rank 4 Theorem and the 2-Generated Core Theorem	35
1.6. The B -Conjecture and the Standard Component Theorem	41
1.7. The Unbalanced Group Theorem, the $2A_n$ -Theorem, and the Classical Involution Theorem	44
1.8. Finishing the Unbalanced Group Theorem and the B -Theorem	48
1.9. The Odd Standard Component Theorem and the Aschbacher-Seitz reduction	53
1.10. The Even Standard Component Theorem	55
Summary: Statements of the major subtheorems	59
Chapter 2. Overview: The classification of groups of characteristic 2 type	63
The Main Theorem for groups of characteristic 2 type	63
2.1. The Quasithin Theorem covering $e(G) \leq 2$	65
2.2. The trichotomy approach to treating $e(G) \geq 3$	66
2.3. The Trichotomy Theorem for $e(G) \geq 4$	69
2.4. The $e(G) = 3$ Theorem (including trichotomy)	75
2.5. The Standard Type Theorem	77
2.6. The $GF(2)$ Type Theorem	77
2.7. The Uniqueness Case Theorem	78
Conclusion: The proof of the Characteristic 2 Type Theorem	80

Outline of the classification of groups of characteristic 2 type	83
Chapter 3. $e(G) \leq 2$: The classification of quasithin groups	85
3.1. Introduction: The Thompson Strategy	86
3.2. Preliminaries: Structure theory for quasithin 2-locals (SQTK-groups)	88
3.3. More preliminaries: Some general techniques	90
3.4. The degenerate case: A Sylow T in a unique maximal 2-local	98
3.5. The Main Case Division (Possibilities for a suitable group \bar{L} and module V)	100
3.6. The Generic Case—where $\bar{L} = L_2(2^n)$ with $n > 1$	103
3.7. Reducing to V an FF-module for \bar{L}	106
3.8. Cases with \bar{L} over \mathbf{F}_{2^n} for $n > 1$	109
3.9. Cases with \bar{L} over \mathbf{F}_2 (but not $L_3(2)$)	111
3.10. Cases with $\bar{L} = L_3(2)$, and analogues for $L_2(2)$	117
3.11. The final case where $\mathcal{L}_f(G, T)$ is empty	120
3.12. Bonus: The Even Type (Quasithin) Theorem for use in the GLS program	123
Chapter 4. $e(G) = 3$: The classification of rank 3 groups	127
4.1. The case where $\sigma(G)$ contains a prime $p \geq 5$ The Signalizer Analysis	128
The Component Analysis	130
4.2. The case $\sigma(G) = \{3\}$ The Signalizer Analysis	134
The Component Analysis	142
Chapter 5. $e(G) \geq 4$: The Pretrichotomy and Trichotomy Theorems	149
5.1. Statements and Definitions	149
5.2. The Signalizer Analysis	152
5.3. The Component Analysis (leading to standard type)	159
Chapter 6. The classification of groups of standard type	173
6.1. The Gilman-Griess Theorem on standard type for $e(G) \geq 4$ Identifying a large Lie-type subgroup G_0	174
The final step: $G = G_0$	177
6.2. Odd standard form problems for $e(G) = 3$ (Finkelstein-Frohhardt)	180
Chapter 7. The classification of groups of $GF(2)$ type	183
Introduction	184
7.1. Aschbacher's reduction of $GF(2)$ type to the large-extraspecial case	185
7.2. The treatment of some fundamental extraspecial cases	188
7.3. Timmesfeld's reduction to a list of possibilities for \bar{M}	192
7.4. The final treatment of the various cases for \bar{M}	199
7.5. Chapter appendix: The classification of groups of $GF(2^n)$ type	204

Chapter 8. The final contradiction: Eliminating the Uniqueness Case	213
8.1. Prelude: From the Preuniqueness Case to the Uniqueness Case	215
8.2. Introduction: General strategy using weak closure and uniqueness theorems	223
8.3. Preliminary results and the weak closure setup	226
8.4. The treatment of small $n(H)$	230
8.5. The treatment of large $n(H)$	234
Appendices	249
Appendix A. Some background material related to simple groups	251
A.1. Preliminaries: Some notation and results from general group theory	251
A.2. Notation for the simple groups	254
A.3. Properties of simple groups and K -groups	256
A.4. Properties of representations of simple groups	261
A.5. Recognition theorems for identifying simple groups	262
A.6. Transvection groups and transposition-group theory	264
Appendix B. Overview of some techniques used in the classification	267
B.1. Coprime action	267
B.2. Fusion and transfer	269
B.3. Signalizer functor methods and balance	272
B.4. Connectivity in commuting graphs and i -generated cores	280
B.5. Application: A short elementary proof of the Dichotomy Theorem	287
B.6. Failure of factorization	290
B.7. Pushing-up, and the Local and Global $C(G, T)$ Theorems	292
B.8. Weak closure	299
B.9. Klinger-Mason analysis of bicharacteristic groups	302
B.10. Some details of the proof of the Uniqueness Case Theorem	305
References and Index	313
References used for both GW type and characteristic 2 type	315
References mainly for GW type (see [Gor82][Gor83] for full list)	317
References used primarily for characteristic 2 type	321
Expository references mentioned	329
Index	333
